## **TinyPet**

Web&Cloud - P. Molli

I want to build a web application for petitions as <u>Avaaz</u> or <u>Change.org</u>. The web application allows to:

- Create a petition
- Sign a petition (cannot sign two times, users are authenticated)
- List petitions signed by a user sorted by date
- List top100 petitions triées par date.
- tag petition/find petition by tag sorted by creation date.

Petitions can be signed by millions of people. The web app has to support millions of petitions.

## Objectives:

- Implement this web application as Google App Engine application:
  - The UI is written in mithril (or equivalent Vue, React, Angular...)
  - The UI calls REST services written with Google Cloud endpoint (Java...)
  - o REST services request and store data in the Google Datastore.

## Rendu

- Par groupe de 3 (au plus)
- fournissez l'URL Google App Engine permettant d'utiliser cette application,
- fournissez l'URL Github ( ou équivalent) permettant de télécharger le code source de votre application, AVEC VOS NOMS !!
- Le "readme" sur github.
  - Screenshot des "Kinds" Google datastore utilisés dans votre appli

- o Qu'est ce qui marche? Qu'est ce qui marche pas?
- Le rendu se fera sur Madoc.
